Choosing the Right Enzyme

Liquid-Filled & Enteric-Coated

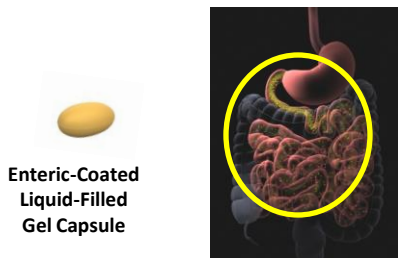

What happens to uncoated capsules and tablets?

- Stomach acid breaks down tablets and capsules.
- Premature release of active enzymes.
- Highly acidic environment of the stomach destroys the majority of enzymes' activities.
- The product may pass through both the stomach and intestine with no absorption if tablet or capsule is of poor quality (i.e. contains binders and fillers).

How is enzyme effectiveness determined?

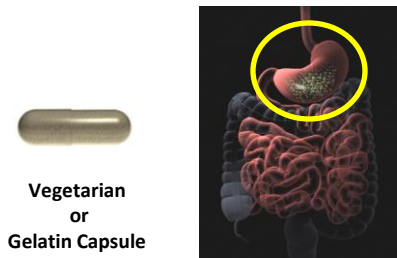

- By the amount of activity level in the bloodstream after the enzyme has been absorbed from the small intestine.
- Enzymes lose activity in low pH (1.0-3.0) of the stomach.
- Unprotected enzymes can lose up to 100% of their activity in 30 minutes or less.
- Enteric coating is the only reliable method to ensure that 100% of enzymes are not destroyed.

Enteric-Coated
Liquid-Filled
Gel Capsule

Enteric-Coated
Tablet.

Vegetarian
or
Gelatin Capsule

The pancreatic juices break down the coating in the duodenum. This makes 100% of the enzyme contents available for absorption into the bloodstream.

A Tablet dissolve very late in the small intestine or bypasses it completely.

Stomach acids breaks down capsule prematurely.
